
HD66100F

(LCD Driver with 80-Channel Outputs)

HITACHI

Description

The HD66100F description segment driver with 80 LCD drive circuits is the improved version of the no longer current HD44100H LCD driver with 40 circuits.

It is composed of a shift register, an 80-bit latch circuit, and 80 LCD drive circuits. Its interface is compatible with the HD44100H. It reduces the number of LSI's and lowers the cost of an LCD module.

Features

- LCD driver with serial/parallel converting function
- Interface compatible with the HD44100H; connectable with HD43160AH, HD61830, HD61830B, LCD-II (HD44780), LCD-III (HD44790)
- Internal output circuits for LCD drive: 80
- Internal serial/parallel converting circuits
 - 80-bit bidirectional shift register
 - 80-bit latch circuit
- Power supply
 - Internal logic circuit: +5V \pm 10%
 - LCD drive circuit: 3.0V to 6.0V
- CMOS process

HD66100F

Comparison with HD44100H

Table 1 shows the main differences between HD66100F and HD44100H.

Table 1 **Difference between Products HD66100F and HD44100H**

	HD66100F	HD44100H
LCD drive outputs	80 × 1 channel	20 × 2 channels
Supply voltage for LCD drive circuits	3 to 6V	4.5 to 11V
Multiplexing duty ratio	Static to 1/16 duty	Static to 1/32 duty
Package	100-pin plastic QFP	60-pin plastic QFP

Ordering Information

Type No.	Package
HD66100F	100-pin plastic QFP (FP-100)
HD66100FH	100-pin plastic QFP (FP-100B)
HD66100D	Chip

HD66100F

Pin Arrangement

Pin Description

V_{CC}, GND, V_{EE}: V_{CC} supplies power to the internal logic circuit. GND is the logic and drive ground. V_{EE} supplies power to the LCD drive circuit.

V1, V2, V3, and V4: V1 to V4 supply power for driving an LCD (Figure 2).

CL1: HD66100F latches data at the negative edge of CL1.

CL2: HD66100F receives shift data at the negative edge of CL2.

M: Changes LCD drive outputs to AC.

DI: Inputs data to the shift register.

DO: Output data from the shift register.

SHL: Selects a shift direction of serial data. When the serial data is input in order of D1, D2, ..., D79, D80, the relation between the data and the output Y is shown in Table 3.

Y1–Y80: Each Y outputs one of the four voltage levels—V1, V2, V3, or V4—according to the combination of M and display data (Figure 2).

NC: Do not connect any wire to these terminals.

Table 2 Pin Function

Symbol	Pin No.	Pin Name	I/O
V _{CC}	46	V _{CC}	—
GND	36	Ground	—
V _{EE}	31	V _{EE}	—
V1	32	V1	—
V2	33	V2	—
V3	34	V3	—
V4	35	V4	—
CL1	37	Clock 1	I
CL2	40	Clock 2	I
M	44	M	I
DI	41	Data in	I
DO	42	Data out	O
SHL	39	Shift left	I
Y1–Y80	1–30, 51–100	Y1–Y80	O
NC	38, 43, 45, 47–50	No connection	—

Block Functions

LCD Drive Circuits

Select one of four levels of voltage V1, V2, V3, and V4 for driving a LCD and transfer it to the output terminals according to the combination of M and the data in the latch circuit.

Latch Circuit

Latches the data input from the bidirectional shift register at the fall of CL1 and transfer its outputs to the LCD drive circuits.

Bidirectional Shift Register

Shifts the serial data at the fall of CL2 and transfers the output of each bit of the register to the latch circuit. When SHL = GND, the data input from DI shifts from bit 1 to bit 80 in order of entry. On the other hand, when SHL = V_{CC}, the data shifts from bit 80 to bit-1. In both cases, the data of the last bit of the register is latched to be output from DO at the rise of CL2.

Figure 3 Relation between SHL and the Shift Direction

Figure 4 Block Diagram

Primary Operations

Shifting Data

The input data DI shifts at the fall of CL2 and the data delayed 80 bits by the shift register is output from the DO terminal. The output of DO changes synchronously with the rise of CL2. This operation is completely unaffected by the latch clock CL1.

Latching Data

The data of the shift register is latched at the negative edge of the latch clock CL1. Thus, the outputs Y1–Y80 change synchronously with the fall of CL1.

Switching Data Shift Direction

When the shift direction switching signal SHL is connected with GND, the data D80, immediately before the negative edge of CL1, is output from the output terminal Y1. When SHL is connected with V_{CC} , it is output from Y80.

Figure 6 Timing of Latching Data

Figure 7 SHL and Waveforms of Data Shift

Absolute Maximum Ratings

Item		Symbol	Ratings	Unit	Note
Supply voltage	Logic circuits	V_{CC}	-0.3 to +7.0	V	1
	LCD drive circuits	$V_{CC}-V_{EE}$	-0.3 to +7.0	V	
Input voltage (1)		VT1	-0.3 to $V_{CC} + 0.3$	V	1
Input voltage (2)		VT2	$V_{CC} + 0.3$ to $V_{EE} - 0.3$	V	2
Operation temperature		T_{opr}	-20 to +75	°C	
Storage temperature		T_{stg}	-55 to +125	°C	

Notes: 1. A reference point is GND (= 0V)
 2. Applies to V1–V4.

Note: If used beyond the absolute maximum ratings, LSIs may be permanently destroyed. It is best to use them at the electrical characteristics for normal operations. If they are not used at these conditions, it may affect the reliability of the device.

HD66100F

Electrical Characteristics

DC Characteristics ($V_{CC} = 5V \pm 10\%$, $V_{CC} - V_{EE} = 3.0$ to $6.0V$, $GND = 0V$, $T_a = -20$ to $+75^\circ C$)

Item	Symbol	Terminals	Min	Typ	Max	Unit	Test Condition	Note
Input high voltage	V_{IH}	CL1, CL2,	$0.8 \times V_{CC}$	—	V_{CC}	V		
Input low voltage	V_{IL}	M, DI, SHL	0	—	$0.2 \times V_{CC}$	V		
Output high voltage	V_{OH}	DO	$V_{CC} - 0.4$	—	—	V	$I_{OH} = -0.4$ mA	
Output low voltage	V_{OL}		—	—	0.4	V	$I_{OL} = +0.4$ mA	
On resistance V_i – V_j	R_{ON1}	Y1–Y80 V1–V4	—	—	11	k Ω	$I_{ON} = 0.1$ mA to one Y terminal	
	R_{ON2}		—	—	30	k Ω	$I_{ON} = 0.05$ mA to each Y terminal	
Input leakage current	I_{IL}	CL1, CL2, M, DI, SHL	–5.0	—	5.0	μA	$V_{in} = 0V$ to V_{CC}	
V_i leakage current	I_{VL}	V1–V4	–5.0	—	5.0	μA	Output Y1–Y80 open $V_{in} = V_{CC}$ to V_{EE}	
Current dissipation	I_{GND}		—	—	2.0	mA	$f_{CL2} = 1.0$ MHz	1
	I_{EE}		—	—	0.1	mA	$f_{CL1} = 2.5$ kHz	

Note: 1. Input/output currents are excluded; when an input is at the intermediate level in CMOS, excessive current flows from the power supply through the input circuit. To avoid this, V_{IH} and V_{IL} must be fixed at V_{CC} and GND level respectively.

AC Characteristics ($V_{CC} = 5V \pm 10\%$, $V_{CC} - V_{EE} = 3.0$ to $6.0V$, $GND = 0V$, $T_a = -20$ to $+75^\circ C$)

Item	Symbol	Terminals	Min	Typ	Max	Unit	Note
Data shift frequency	f_{CL}	CL2	—	—	1	MHz	
Clock high level width	t_{CWH}	CL1, CL2	450	—	—	ns	
Clock low level width	t_{CWL}	CL2	450	—	—	ns	
Data set-up time	t_{SU}	DI	100	—	—	ns	
Clock set-up time (1)	t_{SL}	CL2	200	—	—	ns	1
Clock set-up time (2)	t_{LS}	CL1	200	—	—	ns	2
Output delay time	t_{pd}	DO	—	—	250	ns	3
Data hold time	t_{DH}	DI	100	—	—	ns	
Clock rise/fall time	f_{CT}	CL1, CL2	—	—	50	ns	

- Notes: 1. Set-up time from the fall of CL2 to that of CL1.
 2. Set-up time from the fall CL1 to that of CL2.
 3. Test terminal

Timing Chart of Input Waveforms

Figure 13 Timing Chart of Input Waveforms

- Notes:
1. Input square waves of 50% duty cycle (about 30–500 Hz) to M. The frequency depends on the specifications of LCD panels.
 2. The drive waveforms corresponding to the new displayed data are output at the fall of CL1. Therefore, when the alternating signal M and CL1 do not fall synchronously, DC elements are produced on the LCD drive waveforms. These DC elements may shorten the life span of the LCD, if the displayed data frequently changes (e.g. display of hours, minutes, and seconds of a clock). To avoid this, make CL1 fall synchronously with the one edge of M.
 3. In this example, the CMOS inverter is used as a COM signal driver in consideration of the large display area. (The load capacitance on COM is large because it is common to all the displayed segments.)

Usually, one of the HD66100F outputs can be used as a COM signal. The displayed data corresponding to the terminal should be 0 in that case.

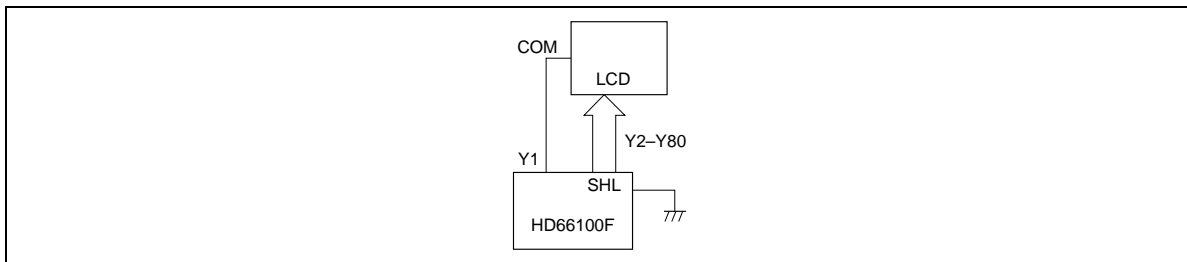

Figure 14 Example of Connection
