

# "Fill the Big Brain" Project

## Searchable Thread Index

### Construction of a Parallax-Propeller-Based Brain

*"I view the Big Brain as a powerful mind with a large domain that it wants to control, organize, and bring together for some higher unknown purpose. I am only the mediator, or moderator of the Big Brain, to help provide for its wants, desires and demands...  
Humanoido"*

**V1.1**

**Pages 1 through 71**

**Posts #1 through #1,415**

**by [Humanoido](#)**

*This project thread is an on-going experiment in Open Source posting. The thread is open source so the project can be constructed as others can follow along and/or contribute. It is different from some open source projects that are constructed and designed behind-the-scenes and then published as open source for use. The index is arranged by pages of consecutive thread numbers. Searching is possible by page number, post number, commentator, and post subject with post sub-title.*

The Brain project began as an idea posted in the Parallax Robotics Forum, with the question posed about a big robotic brain, "What would you put in it?" After considerable discussion, I decided to build an actual brain while maintaining the open source status. Varying phases are explored throughout the posts, such as ideas, design, hardware, assembly, software, testing, mechanics, drawing, and research. It has led to the complete construction of a fully functioning Parallax-Propeller-based robot Brain. The thread may be ongoing as the Brain has now taken on interests of its own.

## Page 1

#01 Humanoido: similarity to a human brain, vision processing, memory, autonomic nervous system

#02 PI-Ro: Use an extremely large array of sensors similar to that of the human nervous system.

#03 Leon: Consciousness.

#04 Erco: I would say that all the brainpower in the world needs to be supported by a robot with equally impressive sensors and mechanicals that use all that processing power to move around in and manipulate the world around it.

#05 Whit: keep "out of trouble." That is, keep it from running into things, running off drops or down stairs. keep itself powered, solar panels, calling out for help, trouble alarm. Basic robot safety (protecting itself) would be my first priority. I guess I would aim for the most basic brain functions first.

#06 TinkersALot: Tongue In Cheek Sardonic Grin Smart Aleck anthropocentric thinking human intelligence

#07 Humanoido: autonomic nervous system, react automatically, hot, cold, light, dark, hunger, full, touch, smell, noise, tilt, terrain, wind, hurt

#08 Sylvie369: NYT article link

#09 Humanoido: the brain can be bigger, faster and use more sophisticated AI

#10 Humanoido: Single skill evolution can become evolved, EXPO robots

#11 Lardom: Robot charging station

#12 Humanoido: Determine right from wrong, prioritize

#13 Humanoido: Personality mode

#14 Erco: A sense of duty

#15 PI-Ro: It can vote

#16 Humanoido: interpret the law, a philosophical center

#17 Humanoido: fuzzy logic, less rigid, average, approximate, result inconclusive, gray water, interpret vision, sets of general algorithms apply across the board

#18 Humanoido: snap decisions and judgements when there is limited or no time to think

#19 Humanoido: emotional center, interest heightened or lack, robust behaviors = interesting activities

#20 Humanoido: Transfer information, cog to cog wiring, special brain lobe

## Page 2

#21 Humanoido: Thinking faster than original prop specs, internal pure thought should be the fastest

#22 Humanoido: algorithms to transport/understand information/thought, machine approximation

#24 Humanoido: smaller brain, model after the bigger brain, fit hobby budget/resources, go above and beyond the basics, basics include vision, obstacle avoidance, beeping,

moving in some patterns, determining location/orientation, sumo, maze solving, wandering, not falling off ledge, ranging, mapping, accepting input from sensors, recharge batteries, beyond basics include thinking, reasoning, ability to resolve problems, accept new challenges

#25 Humanoido: Multi-Brain Concept a duplicate brain, help Alzheimer's, double brain power

#26 Humanoido: (brain in a brain) 2nd brain housed inside the 1st. Though I expect the ability to connect and disconnect brains on the outside would be a useful feature in times of service, debugging or expanding with more brains. Maybe if brains are made inexpensively, they could be discarded and recycled. With multiple brains come dedicated brains. Brains could be located anywhere inside the robot. How about off-the-shelf brains. Companies could compete to see who can make the best brain.

#27 Humanoido: a big brain can be filled with interconnected hybrid processors

#28 Humanoido: A Brain Chart, Brain Stem - route information via nerve center to mobility center

#29 Ratronic: where is the link to the brain chart?

#30 Humanoido: provided link

#31 Humanoido: 1st Hybrid Brain Processor working, 2 languages, 1st successful prototype brain stem

#32 Humanoido: Robotic Brain Stem (with photo)

#33 Humanoido: with photo, Adding the Brain Base to the Big Brain

#34 Humanoido: Robotic Brain Filler

#35 Whit: Please continue posting, very interesting. Don't let the lack of posting discourage you

#36 Humanoido: moved into the next phase which is the actual construction of the brain.

#37 Humanoido: A Working Robot Brain Blob! (with photo)

#38 Humanoido: The Next Brain Blob Addition

#39 Humanoido: Brain Blob Software (Blobber Code)

#40 Humanoido: Open Source

### Page 3

#41 Humanoido: Proto Board Brain Surgery Technique to Reduce Power Consumption

#42 Humanoido: Soldering Brain Pins

#43 Jonlink0: action potentials that can be sent are excitatory, and each neuron only has an 8-cell (moore) neighborhood, "waves" of action potentials will grow chaotically from a disturbance in the medium. Some method of creating inhibitory action potentials (perhaps utilizing extra cell states?), as well as input/output methods (easily done by changing certain cell states according to the states of the robot's sensors), may cause interesting behavior. Some sort of inhibitory action potentials are obviously necessary to prevent the automaton from becoming saturated with chaotic activity, which is what Brian's Brain will default to if given semi-random sensor input.

#44 Humanoido: more processors ideal for neural net neuron simulations

#45 Humanoido: software with self reasoning power. It doesn't need to be an Einstein but some intelligence greater than a bug would be appreciated. Memory needs to be added, as so far the sum total is reference eeprom at 20 x 32KRAM. Propeller can access PC and the PC has TeraBytes of operating storage, use a server to provide wireless data storage. Web access can provide a knowledge base to work with.

#46 Humanoido: Brain Guts Data Light Convert Power LED to a Data LED (Parallax Propeller Proto Board)

#47 Humanoido: Brain Definitions as Applied to the Brain Blob The list of Brain components...

#48 Humanoido: Jumper Leads  
#49 Humanoido: Brain Span Construction  
#50 Humanoido: Brain Blobatory Breadboard Retrofit  
#51 Mike G: you do not need a big brain. You need a big network with many specialized processor nodes.  
#52 Humanoido: Open Source Project  
#53 Humanoido: acting upon information received from some giant server.  
#54 Mike G: use one specialized processors for vision, one for hearing, one for voice recognition, and one for speech. Abstracting these tasks makes the whole much more extensible and it allows a device to contain only the nodes needed to fulfill a particular task. Plus it would be easier to place the specialized nodes anywhere on the device.  
#55 Humanoido: Brain Blob Preliminary Specs  
#56 Mike G: why use a full or half duplex bus over say an 8-bit or 16-bit parallel bus  
#57 Humanoido: Brain Stem is using a BASIC Stamp which is capable of doing one thing at one time, full duplex would be meaningless. Half duplex is an ideal match because it's dedicated to motor mobility functions which happen relatively slowly anyway. The Propellers run at full duplex, which do the upper thinking and higher brain data transfers at higher speeds, hence the hybrid terminology. The master can treat 21 EEPROMs across the slaves as one distributed EEPROM equal to the sum of the individual parts.  
#58 Humanoido: Processors tasked out to do specific jobs. Generally in the OBEX we see apps that run in specific cogs. Dedicating cogs/processors to these specific areas of the brain is entirely feasible. The human brain is tasked out in a similar fashion, i.e. a place for vision, motor functions, speech, memory, etc.  
#59 Mike G: I can't wrap my mind around the logic it would take to coordinate such memory access  
#60 Humanoido: The master can assign indexing to each prop board to define its location which gets stored into eeprom. Slaves and Master can access this global eeprom memory storage location to determine who's who and where they're located. These character maps are drawn out and stored in eeprom, then globally accessed. It's also simple to write a routine to pass variables and store them in specific eeproms. Access is by asking the slave for the information. The IC2 connection is transparently local to any requests and of no global concern.

## Page 4

#61 Mike G: I see code executing in a COG on every Prop that deals with bus arbitration and some kind of packet protocol. You'll need a way to process and organize the disparate EEPROM data.  
#62 Ravenkallen: develop a weather forecasting module  
#63 NikosG: Brain1: Survivability e.g. by returning to a recharging station, or keeping itself in light where it could receive recharging through solar panels or tracking the solar panels (at this point I can contribute) Brain2: Ability to move autonomous and avoid obstacles, and also to choose the best way (Maze problem) Brain4: Ability to take a variety of measurements (use any kind of sensors) (I agree with "Ravenkallen") Brain3: remote communication with it master (ability to send data and receive commands) Brain5: Ability to perform task using a robot arm Brain6: Ability to transform Itself (change shape or leave some mechanical parts in order to achieve something). Have you ever thought your robotic "big Brain" to have a mechanism that can add or remove the appropriate card in a specific socket?  
#64 Humanoido: brain ground based exploration, process telemetry from the probe or satellite

#65 Humanoido: Processing/organizing disparate EEPROMs assigned to master or sub master  
#66 Humanoido: legs move, fix things, small hands to reach/grasp, control, perform tasks  
#67 Humanoido: tasking interface that could serve as a standard connection point to the outside world  
#68 Humanoido: link to USB cable powers Protoboards not over 500mA, for testing and development  
#69 Software Overview  
#70 Hardware Development  
#71 Humanoido: staid algorithms, maze solving, faster, more efficient/sensors, sensors at each side, special sensor - high up telescoping mirror looks at maze top down, ascertain solution differently  
#72 Humanoido: shape shifting brain, works with software/hardware, brain carries its own tools/parts, removing one assembly and attaching another, assemblies store in a spare brain cavity  
#73 Mike G: some kind of a bootstapper to "Self Load" code into the multiple Props? Maybe similar to the ZigBee bootloader blog/post?  
#74 Humanoido: software currently uses BASIC Stamp commands beginning at the first level of the Brain Stem which filters upwards through the Brain Base and on through the Brain Span  
#75 Humanoido: bus single wire, two wire, parallel interfaces, self loading, eeprom, crystal propagation, leave room for future development like the first model T car  
#76 NikosG: personal projects with vision, maze, comments  
#77 Humanoido: personal projects comments  
#78 More about the LED Mod (with photos)  
#79 Test Software code used to test the LED modification on the Parallax Propeller Proto Board  
#80 Power Regulator Modification (with photo)

## Page 5

#81 Humanoido: data light will be installed in as many boards as possible. testing will be a separate project.  
#82 Humanoido: follow LED mod installs, decoupling capacitor installation, decoupling capacitor test?  
#83 Brain Blob (Dangerous Growth Spurt?) (with photos)
